# Parking lot USB exercise

| | |
|---|---|
| **Contents** | *There are some private files, like his family pictures, dog photos, and also a new hire letter. His resume is also listed there which may contain very personal details such as contact info and his previous work details. This does not seem like a safe way to store personal and work files.* |
| **Attacker mindset** | *The file contains a wedding list which might contain the contact details of all his most important and close relatives. An attacker may call them and pretend to be his colleague. It can have many dangerous consequences.*<br><br>*The new hire letter seems like he has already found a job somewhere. There is also another file that details the shift schedules which clearly contains information of where the staff would be at the exact time. It can also be exploited in some way to get around the hospital and various other things.* |
| **Risk analysis** | *Storing your work files separately is most secure and advisable. It's also important to have the usb password protected so even if it's lost no one can have access to it right away. It can have malicious software like keylogger or others to encrypt your files.* |
